

# Classified Spillage Solution for ePO™ Users

AccessData

## A Government Agency's Last Line of Data Defense...

Protecting classified data and personally identifiable information are two great challenges facing government agencies today. Too often organizations rely on the process of accidental discovery when it comes to detecting classified spillage. Once detected the required response may range from the simple search of a handful of machines to a massive, comprehensive audit of thousands of computers. The technical implications of a massive content audit are staggering, and there is a lack of technologies available to address such an audit.

Without scalable, deep, forensic auditing and remediation capabilities, organizations must wait for somebody to report a data spill. Then they are only able to pursue manual, time-sensitive and error-prone solutions, such as a machine-by-machine search. To truly ensure the protection of classified and personal data, government agencies need an automated way to quickly and thoroughly search thousands of machines, and that is exactly what AccessData's Classified Spillage solution is designed to do.

## BENEFITS:

**Easy agent deployment using ePolicy Orchestrator®:** Quickly audit ePO managed assets for fast and effective response to spillage incidents.

**Protect classified data:** Identify and log the locations of classified files that have spilled onto unclassified networks, using any combination of search criteria.

**Protect personally identifiable information:** Identify and log the locations of personal information across your network.

**Conduct thorough incident response investigations:** Identify remnants of a network intrusion.

**Respond effectively to alerts:** Quickly correlate user activity with a content monitoring alert and forensically preserve the relevant data.

**Respond quickly to FOIA requests:** End your agency's backlog by automatically collecting and preserving only relevant data.

**Leverage secure remediation capabilities:** Securely remediate from a central location with DoD-certified wiping capabilities. You can also wipe rogue files and replace with stub documents.

## CORE FEATURES:

### 360-Degree Visibility into All Data

- Laptops and Desktops
- Databases
- Email Servers
- Network shares
- More than 30 structured data repositories

### Comprehensive Search

- Keywords (Eyes Only, SS# etc.)
- Date ranges (created/modified/accessed)
- Data source (share, email, SharePoint, etc)
- Hashes (to include or exclude)
- File Type (300+ pre-defined types)
- File size
- File status (deleted, hidden)
- Location (C:\my documents\..)

### Secure Remediation

- DOD-certified wiping
- File wipe and replace

Centrally manage proactive and reactive auditing operations and monitor real-time status and results.

## HOW IT WORKS:

The classified spillage solution is the first phase in our development of AccessData® Information Assurance. It is designed to allow a single analyst working from a central, secure web console to forensically search the content on information assets of all kinds, across the network in an automated manner. With an easy-to-use interface, that requires little or no training, and a highly scalable and intuitive design, this technology provides a comprehensive and automated solution to the full spectrum of content auditing issues faced by government agencies.

### Use ePolicy Orchestrator® to deploy AccessData eDiscovery...

Quickly and easily deploy AccessData agents on any ePO-managed asset.

Query ePO™ to correlate users in its database with assets or activities under investigation.

View agent coverage reports that include publisher, product, version and more.
